Recent studies have indicated that epigenetic processes may play a major role in both cellular and organismal aging. These epigenetic processes include not only DNA methylation and histone modifications but also extend to many other epigenetic mediators such as the polycomb group proteins, chromosomal position effects, and noncoding RNA. The topics of this book range from fundamental changes in DNA methylation in aging to the most recent research on intervention. From the reviews: "This nearly 500 pages thick book covers almost everything around the topic of how aging and age-related diseases might be affected by epigenetic processes." Understanding the drifting and stochastic nature of aging is crucial.
